

Textbox Control Overview

Last Modified on 03/06/2018 2:12 am EST

The Textbox control is a basic ASP.NET control.

Textbox Control Features

Feature	Description
Overview	General information about the Textbox control. For more information, click here .
AutoComplete	Creates a list of values based on values entered by the user, which displays when the user subsequently accesses the text box. For more information, click here .
Validation	Validate user input. For more information, click here .
Context Menu	A context menu with built-in commands displays when users right-click the control. For more information, click here .
Spell Checking	Enable users to spell check the values they enter in the text box. For more information, click here .
Password Strength Checker	Customize required password strength. For more information, click here .
Client-side Object Model	Extend the Textbox control functionality by using the client-side API. For more information, click here .

Note: The TextArea control is the same as the Textbox control with the *TextMode* set to *MultiLine*.
