

Validations Overview

Last Modified on 03/06/2018 2:15 am EST

Dynamic workflow forms use out-of-the-box ASP.NET functionality for validations. ASP.NET contains validation controls and infrastructure that you can use to validate forms. The most basic use case for validating a form is to define required fields.

You can perform advanced validation, using the following controls, which are available in the the UX Studio toolbox.

Advanced Validators Options

Validators	Description
Required Field Validator	Displays an error message if the user does not enter a value for the field.
Range Validator	Defines a range for a validation.
Regular Expression	A regular expression validator.
Compare Validator	Compares the user value with the provided value.
Custom Validator	Define custom code for client-side or server-side validation.
Validation Summary	Organizes all validation messages into a single summary.
