

# Split Activity Overview

Last Modified on 12/03/2017 7:45 am EST

## Context

Use the Split Activity to move the workflow forward to multiple activities, in parallel. The direction that the workflow moves is defined by the result of a set of conditions on several target activities.

## Use Cases

- Simultaneously send a service request to the inventory warehouse to check for available parts, and to customer service so they can contact the customer to confirm receipt of the request.
- Simultaneously send a mortgage application to the background check department and the financial auditing department.

## Wizard Tips

- In the Output Conditions screen, the *Order* parameter defines the order that Sequence checks the conditions.

Order	Target activity	Condition
1	manager approve	{Expense Request}.Subform("Item1")["fldSum"] >
2	Message	wf.UpdatedBy.DisplayName = "Accounts"
