Define an FTP/SFTP Connection

Last Modified on 03/26/2017 2:28 am EDT

Context

The first step for many activities is to define an FTP/SFTP connection. There are several connection options, each of which has a unique set of configuration settings.

By default, the connection that you define in this step is the root for all locations you configure in the activity. For example, when you configure the path for a file download, the path is a continuation of the root defined in the connection step.

Wizard Tips

- After you configure the connection, test the connection.
- User name and Password are for the FTP server or file system server. These credentials are used when executing the activity.
