

Download Activity

Last Modified on 06/15/2017 3:58 am EDT

Context

Import files from an external target system to Cora SeQuence. A file download has its own data model, to which the file is saved. With the Download Activity, you can download a single file or multiple files. The Download Activity does not support zipping or unzipping files. The files are stored in Cora SeQuence as attachments.

Use Cases

- Download a file to Cora SeQuence that is stored on an external system.
- Use the downloaded file as an attachment in any other process.

Wizard Tips

- The **Root** is created when you define the FTP/SFTP connection.
- The **Folder** is the path where the file you want to download is located.
- The **File Pattern** defines the files you are downloading. You can define two file pattern types.
 - Specific file, for example, `TestFile.txt` .
 - File extension, for example, `*.csv` .
- When you select the **Delete file after download** check box, imports and then deletes the file from the source system (where you downloaded the file).
