## UX Studio Overview

Last Modified on 02/18/2021 12:34 pm EST

The UX Studio is a .NET markup editor tool that provides developers a web-development environment to build forms. It includes several modes of work for basic and advanced users and separates the data model from the view to enable work on each one separately.

You can use the same data model to create several views of the form, such as desktop and mobile views.

You can work with the UX Studio in different modes, depending on your needs.
