

Version Management for Workflows

Last Modified on 12/05/2018 9:16 am EST

Overview

Cora SeSequence enables superior control over changes to processes and process version management.

- Modifications to processes that are in production. These modifications take effect immediately.
- The ability to swap the production version with the latest development version of a process. Process instances that are in production run according to the new version.
- Active version management: developers can manage multiple versions of a process in any environment, and can determine which version is active at any given time.

Manage "Temp Convert" Versions ?

Manage workflow versions using the options below.

What would you like to do?

 [Create a new workflow version](#)
Create a new version of this workflow under this workflow space.

 [Create a copy of this workflow](#)
Create a copy of this workflow and save it with a new name.

 [Restore workflow](#)
Restore a workflow version from a saved package.

 [Manage saved packages](#)
Manage saved workflow version packages, or create a new workflow version package.

 [Create a new workflow package](#)
You can export the package as a zip file.

Close

Important

When you copy or create a new version of a workflow that contains the following activities:

- Azure Service Bus
- Email Listener
- File Listener

You need to delete the activity in the new workflow and then set it up again.
