

Fetch a Task

Last Modified on 04/24/2017 7:19 am EDT

Use the API to fetch a task.

```
public virtual void FetchTaskInstance(int activityInstanceId, int userId)
{
    IWorkflowExecutionService exe = WorkflowRuntime.Engine.GetServiceWithCheck();
    ActivityInstance activityInstance = exe.GetActivityInstance(activityInstanceId);
    if (activityInstance.FetchedById.HasValue && activityInstance.FetchedById.Value > 0)
    {
        return;
    }

    TaskInstance taskInstance = activityInstance.MessagesInstances.FirstOrDefault(
        t => t.ToId == userId) as TaskInstance;

    if (taskInstance == null)
    {
        return;
    }

    TaskExecutor taskExecutor = new TaskExecutor(taskInstance);
    taskExecutor.Fetch();
}
```
