

Extend Functionality of a Task Activity

Last Modified on 04/24/2017 8:23 am EDT

Write an extension to add functionality to a Task Execute procedure. Task Execute occurs on the following operations:

- Submit
- Fetch
- Return
- Assign
- Others

This example shows how to perform an action during submit, fetch, or return operations.

Activate the Code

1. Add a class library to your solution. Add the relevant references.
 - *PNMsoft.Sequence*
 - *PNMsoft.Sequence.Forms*
 - *PNMsoft.Sequence.Security*
 - *PNMsoft.Sequence.Extension*
2. Strongly sign the project.
3. Complete the code in the relevant places, and compile the assembly.
4. Put the assembly in the GAC.
5. Insert a new record into *tblTemplateWorkflowExtensions*.
 - a. In *fldType*, type the assembly strong name.
 - b. In *fldGuid*, type the GUID in the class decorator.

NOTE: If your code raises an exception, execution will continue.

using System;  
using PNMsoft.Sequence;  
using PNMsoft.Sequence.Forms.Activities;  
using PNMsoft.Sequence.Forms.Activities.Operations;  
  
namespace SequenceEx.Tasks.Samples  
{  
    [WorkflowElementExtension("Generated Guid", Name = "TaskActivityExtension")]  
    public sealed class TaskActivityExtension : WorkflowElementExtension  
    {  
        public TaskActivityExtension()  
        {  
        }  
  
        protected override void OnAttached()  
        {  
        }  
    }  
}
```

```
base.OnAttached();

this.Owner.Executed += new EventHandler(OnActivityExecuted);
}

protected override void OnDetached()
{
base.OnDetached();

this.Owner.Executed -= new EventHandler(OnActivityExecuted);
}

private void OnActivityExecuted(object sender, ActivityExecutedEventArgs e)
{
object inputData = e.Context.InputData;

if (inputData is SubmitTaskOperationContext)
{
SubmitTaskOperationContext submitTaskOperationContext = (SubmitTaskOperationContext)inputData;

//Insert your code here.
}
else if (inputData is FetchTaskOperationContext)
{
FetchTaskOperationContext fetchTaskOperationContext = (FetchTaskOperationContext)inputData;

//Insert your code here.
}
else if (inputData is ReturnTaskOperationContext)
{
ReturnTaskOperationContext returnTaskOperationContext = (ReturnTaskOperationContext)inputData;

//Insert your code here.
}
}
}
```
