

Install and Configure the Remote Web Parts Feature

Last Modified on 07/01/2019 10:58 am EDT

The Remote Web Parts feature enables you to display Flowtime data on a server that has SharePoint installed, but not Cora SeQuence. By default, you install Flowtime on a server that has SharePoint. The Flowtime Web parts and data are exposed on that server. If you cannot install software on your SharePoint farm, or if you have numerous Web front servers that need to display Cora SeQuence data, but you do not want to repeat Cora SeQuence installation, you should use the Remote Web Parts feature.
