

Web Service Input Activity Overview

Last Modified on 08/24/2023 5:36 am EDT

Context

Use the Web Service Input Activity to select a Web service and method that you want to listen to in a dynamic workflow.

Use case

- Use this activity as part of a workflow that also contains a Web Service Output Activity.

Wizard tips

Properties Tab

- **Name:** the name you select affects the virtual and local path.

Methods Tab

- **Method List** (left panel): Your selection in this list affects the content that displays in the XSD structure and details area. You can add, edit, or delete methods defined in this listener.
- **XSD structure and details** (middle panel): The structure displays according to the selected method and the selected message (response or request).
- **Element Properties** (right panel): Set and modify the element type and advance settings for the selected element.

XML Schema Area

- Describes the structure of our WSDL document used in the method's request and response. If you have a complex-type object that you want to use more than one time in your WSL, you can define its structure here.
- To create an array element, you must specify that the *Max Occurs* property of its <sequence> is **unbounded**, and the *Min Occurs* and *Max Occurs* property of the entity is set to 1.

View WSDL Area

- This is where you can view the WSL's Web Services Description Language (WSDL), which is an XML-based language for describing Web Services, how to access the services, and the elements' attributes.
