

# Add a Code Snippet

Last Modified on 03/05/2019 12:41 pm EST

## Overview

Use code snippets to extend functionality in Forms. Cora SeSequence provides pre-configured snippets.

When you create a snippet file, you can create one file for each snippet, or a file that contains multiple snippets.

Cora SeSequence snippets support the following languages:

- HTML
- JavaScript
- CSS

**Note:** Cora SeSequence supports Visual Studio snippets.

## Snippet Tokens

Cora SeSequence provides two built-in tokens.

- *\$selected\$*: represents text selected in the document that is inserted into the snippet when invoked.
- *\$end\$*: the cursor's location after you insert the code snippet.

## Procedure

1. Create a snippet file with a `.sqsnippet` extension.  
Example: `alert.sqsnippet`
2. Copy the snippet file to `~/Shared Resources/Components/Forms/Snippets/SnippetLanguage`.  
You can create an additional directory. This directory appears as a node in the tree in the snippets wizard.
3. Recycle the Administration site Application Pool for the changes to be implemented.

## Single Snippet Example

```
javascript
PNMsoft
Code snippet for a do...while loop
do
```

## Multiple Snippets Example

...
