

## Runtime Expressions (rt)

Last Modified on 08/18/2022 4:52 am EDT

Runtime expressions include runtime context data and metadata that you access using the *rt* prefix, and *1-n* per user session. You can only use runtime expressions during runtime. You cannot use runtime expressions in business rule expressions or for composing a message.

Runtime expressions enable users to retrieve any data related to the runtime context, for example:

- **User's display name:** *rt.CurrentUser.DisplayName*
- **HTTP request query string:** *rt.HttpRequest.QueryString["ItemID"]*
- **Server variables:** *rt.HttpRequest.ServerVariables["SERVER\_NAME"]*

From the runtime object, you can get to the workflow instance using *rt.workflowinstance*.
