

Use the AsQueryable Method in an Expression

Last Modified on 11/30/2017 7:04 am EST

When you use the *AsQueryable* attribute in an expression, the query is executed at the database level (rather than in memory). Use this attribute when dealing with tables without a key, or when handling a high volume of records.

Note: Using this method might affect system performance.

Example of Expression with the AsQueryable Method

```
{activity}.Query("QueryWithoutSystemKeys").AsQueryable().First(Field("fldWfld") == wf.WorkflowInstanceId).Field("Field1")
```
