

Configure BRS to Send Mail Using Office 365

Last Modified on 11/28/2017 8:51 am EST

In the BRS config file, edit the email thread setting. It should look like this:

```
smtpServer="smtp.office365.com" smtpPort="587" username="yourusername" password="yourEncryptedPass  
word" enableSsl="true" useDefaultCredentials="false" isHtmlBody="True" attachmentLimitationSize="2  
048" />
```

You should add ***username***, ***password***, and ***enableSsl***, and also set ***useDefaultCredentials*** to false.

The password is encrypted.

You can use the ***EncryptPassword*** utility:
