Create a Custom BRS Thread

To create a custom BRS extension, you create a class that inherits from *IBackgroundRuntimeServiceExecutable,IDisposable*, and include one public execute method (public voice Execute()).

The execute method is invoked according to the interval you specify in the config file.

Add a reference to the *PNMsoft.Sequence.WindowsServices DLL*, and the following using statement:

```
using PNMsoft.Sequence.WindowsServices.BRS.Customization
```

 You must add the DLL to the GAC, and reference it in the *customAssemblies* section of the BRS config file, for example:

You need to restart the BRS.
