

## Save Command Options

Last Modified on 12/03/2017 6:47 am EST

You can add a Submit button and Update button to your forms, which enable users to save the information they entered on the form. To configure the save command option, you give the button a CommandName in the Properties panel. There are two save CommandName options.

- **Save:** saves all controls in the current view, but not the controls in its sub-views.
- **SaveAll:** saves all controls in the current view and in its sub-views.

**NOTE:** In this context, Submit means redirecting to the next activity.

### Submit Button Control

You can add the Submit Button control, which comes with pre-configured, default submit properties.

- command = *SaveAll*
- text = *Submit*

### Forms

- 0 = save, but do not submit.
- 1 = save and submit.

### Tasks

- 1,0 - close the task, save, but do not submit.
- 1,1 - close the task, save, and submit.
- 0,0 - save, but do not close or submit the task (same as just writing 0).
- 1,2 - set the action items that will close when the first user submits the task.
