

Create a Multilingual Form

Last Modified on 01/16/2023 4:50 am EST

Follow this procedure to include more than one language in a single form.

1. Using Visual Studio, create a resource file for the language that you want to create the form.
Example: `MyResourceFile.resx`
2. Add values to the resource file.
 - The key is the value used in the form's markup.
 - The value is the display value in runtime (Flowtime).
3. Translate the resource file to your language, and save it with the corresponding extension.
Example: For Portuguese: `MyResourceFile.pt.resx`
4. Copy the resource files to the application's `App_GlobalResources` directory.
The `App_GlobalResources` directory is located in the application root directory. Create a directory, if the directory does not exist. For example, in the default Flowtime installation, the path is:
`C:\inetpub\wwwroot\Workflow Runtime\App_GlobalResources` .
5. In a form, use the keys in an expression.
Example: `sq8:Label runat="server" Text="%"$ Resources: MyResourceFile, LabelText %" /`
