

## Caching Items in a ComboBox

Last Modified on 05/23/2022 4:59 am EDT

The ComboBox control includes the ***EnableItemCaching*** property, which you can only use in load-on-demand scenarios.

By default, ***EnableItemCaching*** is set to *False*. When it is set to *True*, the combobox caches the returned items for each request.

This means that if you type a certain text and the combobox returns items, the items are cached, and the next time you type the same text, the server-side event *ItemsRequested* does not fire, and the items load from the cache.

This decreases the server round-trips, and improves server performance in high-volume instances.
