

## Conditional Formatting for Server-Side Objects

Last Modified on 07/17/2017 6:17 am EDT

You can calculate the visibility of a server-side object in runtime using an expression that checks a query string parameter.

In this example, we change the style of a grid.

```
Visible=' <%$ sq:{ iif(rt.httprequest["IsNewItem"]="true",True ,False) } %> '
```

**NOTE:** You cannot add anything before or after the expression inside the `visibility=[yourexpression]` section.
