Deploy the SAP activity

Last Modified on 11/15/2021 9:19 am EST

V9.2.1

If your system integrates with SAP, you need to run additional scripts after you deploy the Cora SeQuence database and applications.

Prerequisites

Before you run the scripts, make sure that:

- The SAP license has been activated.
- You've deployed the Premium package.
- Credentials to access the Cora SeQuence repository.

For more details on deploying Cora SeQuence, see the *Deployment process* section in this article.

Procedure

Run the following scripts on all servers that host Cora SeQuence applications.

1. Download the **CoraSeQuenceSAPInstallation** ZIP, and extract it.
2. To add the SAP activity types, run the **SAPConnectorActivity** script on your Cora SeQuence database.
3. To deploy the SAP activity components, on all servers that host Cora SeQuence applications, run the **CoraSeQuenceSAPInstallation PowerShell** script.
