

Deploying a non-Microsoft SQL Database

Last Modified on 04/20/2022 5:35 am EDT

Overview

In addition to the Microsoft SQL server database, Orchestration Services currently supports the PostgreSQL database. You can set up the PostgreSQL database using a PowerShell function.

Before you begin

Before you deploy the database, make sure that:

- ✔ The database is setup.
- ✔ Java is installed on the server where you are running the PowerShell scripts.
- ✔ The latest [PowerShell modules](#) are installed.

Procedure

1. Run the [Install-CoraSeQuenceDatabaseLiquibaseChangeSets](#) function.

NOTE

Database files are installed in default locations, as configured on the database server. If required, after installation, you can move the files using the standard procedure.
