

# Add Connection Credentials

Last Modified on 07/17/2024 10:18 am EDT

Starting with V10.0, Cora SeSequence has been renamed to Cora Orchestration.

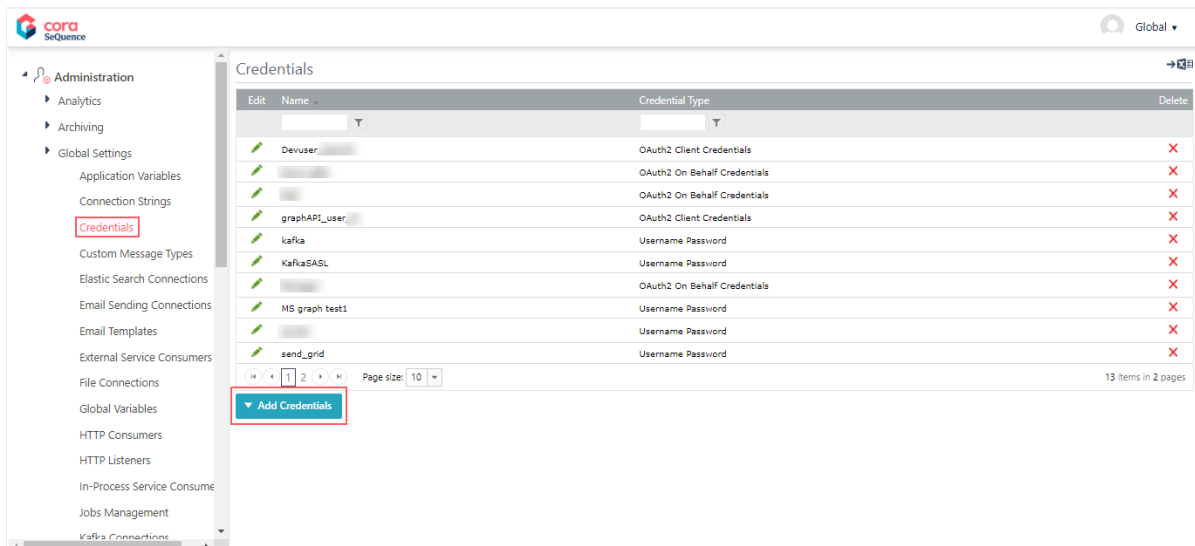

## Overview

All connections to external services need to be authenticated. You can create different credential types based on the service authentication requirements.

- Username Password: Basic authentication using username and password.
- OAuth2 Client Credentials: Connects with external services using client confidential authentication.
- OAuth2 On Behalf Credentials: Connects with external services using a delegated user identity authentication.

## Procedure

1. In the Administration site, go to **Administration>Global Settings>Credentials**.
2. Click **Add Credentials**.

3. Select the credential type:
  - Username Password
  - OAuth2 Client Credentials
  - OAuth2 On Behalf Credentials

## Create a Username Password credential

1. On the Add Record To: Credentials page, add the following details:
  - Name: A unique credential name.
  - User Name: Credential username.
  - Password: Credential password.

- Confirm Password: Reenter the same password to confirm.

### Add Record to: Credentials

**Name \***

**User Name \***

**Password**

**Confirm Password**

2. Click **Add**.

## Create OAuth2 Client Credentials

For details, see [this article](#).

## Create OAuth2 On Behalf Credentials

For On behalf credentials, the parameters remain the same as the credential for which on behalf is created.
