

Change the Behavior of the Close Tab Button

Last Modified on 11/10/2022 1:43 pm EST

You use the Shared Code service to change the behavior of the close tab button.

Example of code added to the **navigator-tabs** component.

```
import { SharedCodeService } from 'services/shared-code';
import { GetInjectedContext } from '../inject-context';
const NavigatorTabs = props => {
  const MainComp = GetInjectedContext('Components.NavigatorTabs');
  SharedCodeService().navigatorTabsRegularTabClose = ({
    event,
    id,
    dispatch,
    actions,
  }) => {
    event.stopPropagation();
    dispatch(actions.closeTab(id));
    //call your code
    console.log(`Tab with ID: ${id} was closed.`);
  };
  return <MainComp props={props}></MainComp>;
};
export default NavigatorTabs;
```
