Side Car Configuration

Overview

In the workspaces that work with AP flow adapter, the file listener takes two files, a PDF and an XML file. The PDF is the document that contains the data, and the XML file contains the meta data of the document. The sidecar.yaml configuration file defines the attributes of the meta data i.e. the name and type of the fields that will be taken from the XML file.

The data fetched by the sidecar.yaml is used in the next steps.

Template

```
kind: document
metadata:
  name: extraction/v1/documents/side-car
spec:
  fields:
    - name: Culture
      type: string

    - name: Case_Id
      type: string

    - name: Input_Source
      type: string

    - name: Creation_Date
      type: string
```

Parameter	Description
Name	Name of the field in the XML.
Type	Data type of the field value.

For example, Case ID can be one of the fields in the document with field name Case_ID and type String.
